## C/C++ programming language II

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables an

constants

Pointers

Summary

### Why C/C++?:

- widely used, both in industry and in education;
- is a high level programming language;
- C++ is a hybrid (multi-paradigm) programming language, implements all the concepts needed for object oriented programming;
- after 40 years from its creation, C++ is still one of the most popular and powerful languages in the world;

## C/C++ programming language III

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Data types

Data types

Dointor

Statement

Summarv

- many of the critical back-end components of Youtube, Google, Facebook, Amazon, Twitter, Microsoft applications, Adobe applications, database systems, physical systems (cars, robots, rockets) are written in C++;
- many programming languages are based on C/C++ (Java, C#). Knowing C++ makes learning other programming languages easier.

## C/C++ programming language IV

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables and

constants

Pointers

Statement

Summary

- C++ is an evolving language;
- C++ is highly standardized;
- C++ gets compiled into processor instructions (no interpretation engine needed).

## Integrated Development Environment for C/C++

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Data types

Pointers

Statemen

Summary

# Microsoft Visual Studio 2019 Community (or Professional/Express/Premium)

- download from https://www.visualstudio.com/download
- offers both an IDE and a compiler.

#### **CLion**

- download from: https://www.jetbrains.com/clion/
- works with Micosoft, macOS and Linux compile toolchains

#### Other options:

- Visual Studio Code
- Eclipse CDT

## Structure of a simple C/C++ program

```
Introduction to C and C++
```

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables and

constants

Pointers

Statement

Summary

Preprocessor directives - e.g. for using libraries;

```
#include <stdio.h>
#include <iostream>
```

 main - special function that is called by the OS to run the program;

```
int main()
{
     //...
    return 0;
}
```

Every statement must end with a semicolon.

## Debugging I

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Data types

., . . . .

Pointers

Statemen

Summary

- Allows us to step through the code, as it is running;
- Execution can be paused at certain points;
- The effects of individual statements can be seen;
- Allows inspecting the current state of the program (values of variables, call stack);
- Breakpoints stop the program when reaching the breakpoint.

### Lexical elements I

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programmin language

Syntax

variables and constants

Pointers

Summarv

C/C++ is case sensitive.

#### Identifier:

- Sequence of letters and digits, start with a letter or \_ (underline);
- Names of things that are not built into the language;
- E.g.: i, myFunction, res, \_nameOfVariable.

### Keywords (reserved words):

- Identifier with a special purpose;
- Words with special meaning to the compiler;
- E.g.: int, for, typedef, struct.

### Lexical elements II

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

#### Syntax

Data types

Variables and constants

Pointers

Statement

Summarv

#### Literals:

- Basic constant values whose value is specified directly in the source code;
- E.g.: "Hello", 72, 4.6, 'c'.

#### **Operators:**

- Mathematical: e.g. +, -, \*;
- Logical: e.g. !, &&.

### Separators:

Punctuation defining the structure of a program: e.g. ";",
 "{}", "()".

### Lexical elements III

C/C++ programming language

Syntax

Data types

D. ....

Statemen

Summary

**Whitespace:** Spaces of various sorts, ignored by the compiler: space, tab, new line.

Comments: ignored by the compiler.

```
// This is a single line comment.
/*
This is
a multiline
comment.
*/
```

## Data types

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Synta

Data types

Variables an

Pointers

Statement

Summary

A **type** is a domain of values and a set of operations defined on these values.

C/C++ are strongly typed languages.

### Fundamental data types in C:

- char (1 byte)
- int (4 bytes)
- unsigned int (4 bytes)
- long int/long (4 bytes)
- float (4 bytes)
- double (8 bytes)
- long double (8 bytes)

Data types in C++: https://msdn.microsoft.com/en-us/library/s3f49ktz.aspx.

## Casting

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++
programming

Syntax

Data types

Variables an

constants

Pointers

\_\_\_\_\_

T directions

Summary

- implicit casting;
- static\_cast.

### DEMO

Type casting (Casting.cpp).

## Arrays

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Synta

Data types

Variables and

Pointers

Statement

Summary

If T is an arbitrary basic type:

- T arr[n] is an array of length n with elements of type T;
- indexes are from 0 to n-1;
- indexing operator: [];
- compare 2 arrays by comparing the elements;
- multidimensional arrays: arr[n][m].

#### **DEMO**

Arrays (Arrays.c).

## C String

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Synta

Data types

Variables an

Pointers

Statement

Summary

 Represented as char arrays, the last character is '\0' (marks the end of the string);

- Handled as any ordinary array;
- Standard library for string manipulation in C (string.h);
  - strlen Returns the number of chars in a C string.
  - strcpy Copies the characters from the source string to the destination string.
    - **Obs.** The assignment operator will not copy the string (or any array).

## C String

### Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Synta

Data types

Variables and constants

Pointers

Statement

Summary

- Standard library for string manipulation in C (string.h);
  - strcmp Compares two strings and returns: zero, if a = b;
     negative, if a < b; positive, if a > b.
    - **Obs.** Using ==, <, >operators on C strings (or any array) compares memory addresses.
  - strcat Appends the characters from the source string to the end of destination string.

**Obs.** None of these string routines allocate memory or check that the passed in memory is the right size.

#### **DEMO**

CStrings (CStrings.c).

## Record - composite type

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Synta

### Data types

constants

Pointers

Summary

- is a collection of items of different types;
- group various data types into a structure.
- declared using struct.

typedef - Introduce a new name for an existing type.

#### **DEMO**

Records (StructExample.c).

### **Variables**

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Jylitax

Бата туре

Variables and constants

Pointers

F.... at ...

Summary

- A variable is a named location in memory;
- Memory is allocated according to the type of the variable;
- The types tell the compiler how much memory to reserve for it and what kinds of operations may be performed on it;
- The value of the variable is undefined until the variable is initialized;
- It is recommended to initialise the variables (with meaningful values) at declaration;
- Use suggestive names for variables.

### Constants

Introduction to C and C++

Iuliana Bocicor, Arthur Molnar

C/C++ programming language

Synta

Data type

Variables and constants

Pointers

Statements

Summary

- Can be defined using the #define preprocessor directive, or the const keyword;
- Can be:
  - integer

```
#define LENGTH 10
const int LENGTH = 10;
```

floating

```
#define PI 3.14
```

string literal

```
const char* pc = "Hello";
```

enumeration constant

```
\begin{array}{lll} \textbf{enum} & \textbf{colors} & \{\text{RED}, \ \textbf{YELLOW}, \ \textbf{GREEN}, \ \textbf{BLUE}\}; \end{array}
```

 More about const at http://duramecho.com/ComputerInfo WhyHowCppConst.html

### Pointers I

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables an

constants

Pointers

Statement

Summary

- Every variable is a named memory location;
- A pointer is a variable whose value is a memory location (can be the address of another variable).

**Declaration:** same as declaring a normal variable, except an asterisk (\*) must be added in front of the variable's identifier.

```
int* x;
char* str;
```

#### **Operators**

- address of operator & take the address of a variable;
- dereferencing operator \* get the value at the memory address pointed to.

#### **DEMO**

Pointers (Pointers.c).

### **Statements**

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

. . . . .

constants

Pointers

Statements

Summary

- A statement is a unit of code that does something a basic building block of a program.
- Except for the compound statement, in C and C++ every statement is ended by ";".

#### Statements in C and C++:

- Empty statement;
- Compound statement;
- Conditional statement: if, if-else, else if, switch-case;
- Loops: while, do-while, for.

#### **DEMO**

Statements (Statements.c).

## Read/Write from/to console

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables and

constants

Pointers

\_ .

Summary

- scanf read from the command line
  - http://www.cplusplus.com/reference/cstdio/scanf/
- printf print to the console (standard output)
  - http://www.cplusplus.com/reference/cstdio/printf/

#### **DEMO**

Read and Write (*ReadWrite.c*).

### **Functions**

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Data type:

Variables and constants

Pointers

Functions

Summary

- A function is a group of related instructions (statements) which together perform a particular task. The name of the function is how we refer to these statements.
- The *main* function is the starting point for every C/C++ program.

### **Declaration (Function prototype)**

```
<result type> name (<parameter list>);
```

```
/*
Computes the greatest common divisor of two
positive integers.
Input: a, b integers, a, b > 0
Output: returns the the greatest common
divisor of a and b.
*/
int gcd(int a, int b);
```

### **Functions**

```
Introduction to C and C++
```

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables an

constants

Pointers

Functions

Summary

#### **Definition**

- return <exp> the result of the function will be the expression value and the function is unconditionally exited.
- A function that returns a result (not void) must include at least one return statement.
- The declaration needs to match the function definition.

## Specification

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

------

Variables an

Pointers

Statement

Functions
Summary

- meaningful name for the function;
- short description of the function (the problem solved by the function);
- meaning of each input parameter;
- conditions imposed over the input parameters (precondition);
- meaning of each output parameter;
- conditions imposed over the output parameters (post condition).

### Function invocation

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Data types

Variables and

Pointers

Statement

Summary

### <name>(<parameter list>);

- All argument expressions are evaluated before the call is attempted.
- The list of actual parameters need to match the list of formal parameters (types).
- Function declaration needs to occur before invocation.

## Variable scope and lifetime I

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programmin language

Syntax

Variables and

Pointers

Statemer

**Functions** 

Summary

**Scope**: the place where a variable was declared determines where it can be accessed from.

#### Local variables

- Functions have their own scopes: variables defined inside the function will be visible only in the function, and destroyed after the function call.
- Loops and if/else statements also have their own scopes.
- Cannot access variables that are out of scope (compiler will signal an error).
- A variable lifetime begins when it is declared and ends when it goes out of scope (destroyed).

## Variable scope and lifetime II

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables an

constants

Pointers

Statement: Functions

Summary

#### Global variables

- Variables defined outside of any function are global variables. Can be accessed from any function.
- The scope is the entire application.
- Do not use global variables unless you have a very good reason to do so (usually you can find better alternatives).

## Function parameters I

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Data types

Variables and constants

Pointers

Functions

Summary

#### Pass by value

E.g.

```
void byValue(int a)
```

- Default parameter passing mechanism in C/C++.
- On function call C/C++ makes a copy of the actual parameter.
- The original variable is not affected by the change made inside the function.

## Function parameters II

## Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Syntax

Variables an

constants

Pointers

Functions

Summary

### Pass by reference

#### In C:

- there is no pass by reference;
- it is simulated with pointers;
- pointers are passed by value.

### E.g.

#### C

```
void byRefC(int* a)
```

$$C++$$

void byRef(int& a)

## Function parameters III

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++
programming
language

Syntax

Variables and

constants

Pointers

Statemen

Functions

Summary

- The memory address of the parameter is passed to the function.
- Changes made to the parameter will be reflected in the invoker.
- Arrays are passed "by reference".

#### **DEMO**

Functions (Functions.cpp).

### Test functions

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Sylltax

Data type

Variables and constants

Pointers

Functions

Summary

#### Assert

```
#include <assert.h>
void assert(int expression);
```

- if expression is evaluated to 0, a message is written to the standard error device and the execution will stop.
- the message includes: the expression whose assertion failed, the name of the source file, and the line number where it happened.

## Function design guidelines

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programming language

Jylitax

Variables and

constants

Pointers

Functions

i unctions

Single responsability principle.

- Use meaningful names (function name, parameters, variables).
- Use naming conventions (add\_rational, addRational, CON-STANT), be consistent.
- Specify and test functions.
- Use test driven development.
- Include comments in the source code.
- Avoid functions with side efects (if possible).

## Summary

Introduction to C and C++

Iuliana Bocicor, Arthur Molna

C/C++ programmin language

Syntax

Data types

Variables ar

Pointers

Functio

Summary

- Both C and C++ are compiled languages.
- All C/C++ programs must contain a *main* function.
- All variables must have types and are recommended to be initialised.
- A variable lifetime begins when it is declared and ends whenit goes out of scope (destroyed).
- C/C++ allow the use of pointers.
- Function parameters can be passed by value or by reference (C++).
